

The **FLEX Data Logger** offers users a **choice** of product with a **built-in antenna** and the option to connect an **external antenna**.

Fitting an external antenna is recommended **when the reception level is insufficient**, for example in buried manholes. This solution makes it possible to fit a remote antenna outside the manhole, **in a clear area**, ensuring that **better GSM reception is achieved**.

Furthermore, different antenna positions can easily be tested before permanently fixing the antenna to a preferably non-metallic base.

Description and fastening

The external antenna, cable and connector provided are watertight.

There are several possible antenna-concealing solutions; *please contact your supplier's technical service for further information.*
